

Graduate attributes and intended learning outcomes

College of Science graduate attributes (in alignment with programs in the college):

After successfully completing a program in one of the College of Science disciplines, graduates are expected to:

- 1. Be familiar with the fundamental and applied principles and concepts of science and connect them effectively
- 2. Use core knowledge and concepts to solve problems in the discipline and in other related scopes.
- 3. Design and execute lab experiments in various science fields with in-depth knowledge and experience of advanced laboratory devices and techniques
- 4. Work competently, individually or in groups, committed to the ethics of scientific research, possessing self-marketing capability, communication skills and propose appropriate ideas to solve related problems
- 5. Use computer and its up-to-date software to analyze and process data and interpret results efficiently
- 6. Formulate scientific and professional reports in the discipline competently.
- 7. Use multiple communication skills to transfer and convey knowledge effectively
- 8. Utilize the modern library as a research tool for all scientific references related to the discipline.

Intended learning outcomes:

A. in-depth Knowledge and understanding:

A1- Competently review sci-tech concepts and theories and their applications in range of pure/ applied sciences and related sciences, linking theory to application.

A2- Describe various natural phenomena based on various scientific concepts

A3- be familiar with various scientific information and knowledge and identify scientific terms

A4- Express in-depth knowledge of the principles and theories of science (according to the discipline)

B. intellectual skills:

B1- Design appropriate models in computer systems to solve / or design and analyze various practical experiments or problems and the results (according to the discipline)

B2- connect various concepts of basic and applied sciences and other sciences

B3- evaluate the results of laboratory and field experiments (according to the discipline), comparing them with the theoretically expected results

B4- Apply qualitative and quantitative thinking to solve scientific problems

B5- Use creative and critical thinking skills to carry out experiments and research , solve the confronting problems and interpret phenomena in the milieu

C. Professional and practical skills:

C1- Scientifically utilize and apply experiments (According to the discipline), pursuing the principles, facts and concepts of security and safety, analyzing results and interpreting them scientifically

C2- efficiently use software and computers in various fields of science (according to the discipline)

C3- employ acquired skills and scientific knowledge in solving related problems empirically and practically in a way that serves society and protects the environment

C4- apply knowledge in computing, devices and techniques to improve work productivity

C5- select appropriate techniques to organize and analyze laboratory results (according to the discipline) for preparing and submitting reports and research papers

D. General or transitional skills:

D1- efficiently practice ongoing learning skills, time management, and laboratory and professional reports preparation.

D2- communicate effectively within a team or as a team leader to solve problems and issues raised

D3- Practice reading and understanding literature from different sources

D4- Use safety procedures in laboratories (according to the discipline) and adhere to professional science ethics.

D5- master communication skills via proper scientific platforms to convey his scientific ideas and information to others in a safe manner that preserves intellectual property rights

D6- manage self-learning through investigation and searching for the required information from databases using various computer programs or through effective communication
